

More Grand Solar Minimum Signs, How Quickly We Forget

[— ADAPT 2030 Video Link —](#)

West of Java Island, Krakatau has erupted another fifty-three times since this article was first put out, plus generated a tsunami and sent ash to 50,000 feet over Christmas. Remember the eruption of Krakatau in the 1880s, was heard thousands of miles away!

The tsunami generated from that 1880's event went around the planet four times. Are you telling me that this is all waking up at the same exact time in the same exact place?

It makes you wonder, what's the connection and the effect of the weakening magnetosphere, the sun entering the Grand Solar Minimum with even smaller solar events on the Sun, and the motion of the jet streams on our planet?

Here is the amplification timeline for the new Eddy Grand Solar Minimum we are in and how quickly it is intensifying. As we move into 2019-20, it's going to amplify several times more than it has so far over these last 12 months.

The shift of our global weather patterns are set to amplify 2x from July-Dec 2017, and from 2018-2019 a 4x shift, with another jump up as the spread widens to 6x in 2019. (I explain this in detail on pages 38-41)

Germany, coldest September morning since weather records began, those records go back to the 1700s.

Then you think, “oh well, the coldest September 23rd ever measured in that same place De Bilt had that record cold last year as well.” What is it with that part of

Parts of Alberta Record their Snowiest September Ever -- More on the Way: Edmonton smashes the previous record set back in 1965.

electroverse.net

The **Weather Network** even pegs the city's snowiest record for Edmonton, other parts of Alberta as well. So it seems to be quite the event.

The Weather Network @weathernetwork

It's officially the snowiest September on record for Edmonton, with the potential for another 20 cm of snow in parts of Alberta this weekend ❄️

ARCTIC ICE GROWING AGAIN

Date: 18/09/18 | Ron Clutz, Science Matters

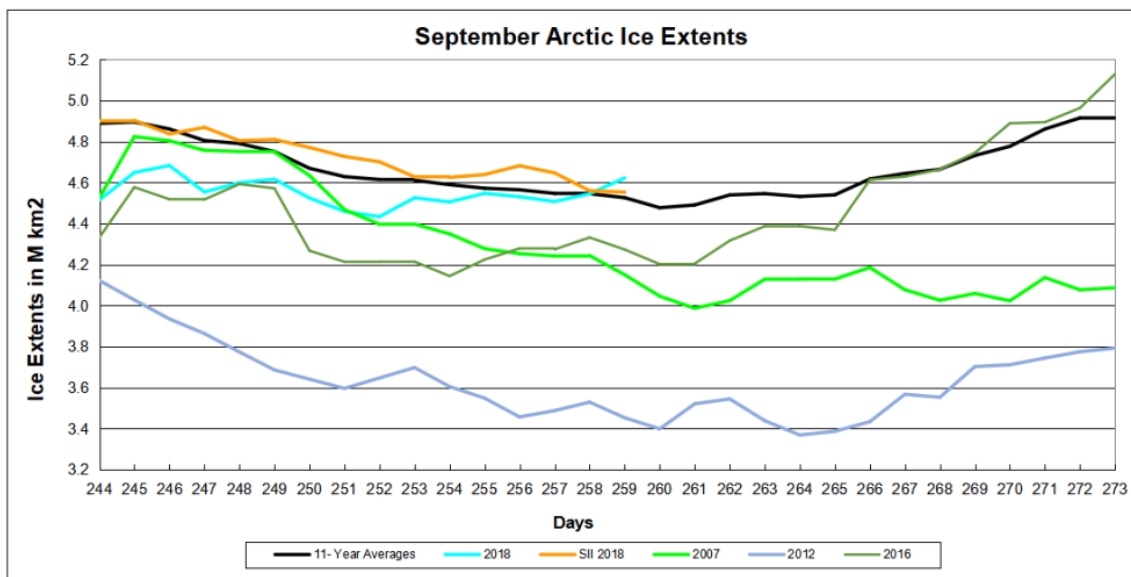

The Global Warming
Policy Forum
Director: Dr Barry Parrott

Arctic ice is presently 472,000 km² more than in 2007, and 1.2 million km² more than the record setting 2012.

Teal is for this year, that's where we are. They've told you it's gone to its lowest ever this year. That is a blatant lie! At least, the fifth and the sixth were going to get a participation trophy for going up in ice, I guess. But it looks like it's starting to track northward and gain. Where over these next record here, it would have decline in ice. I guess we've turned a corner, you would expect this with the intensification of the Grand Solar Minimum.

Thanks for reading, hope you got something out of the article. If you like this type of information find the tri-weekly podcast Mini Ice Age Conversations in depth coverage of these same exact events and analysis of the new Eddie Grand Solar Minimum.

Grand Solar Minimum Book of the Day

Gardening When It Counts: Growing Food in Hard Times

Designed for readers with no experience and applicable to most areas in the world except the tropics and hot deserts. This book shows that any family with access to 3-5,000 sq. ft. of garden land can halve their food costs using a growing system requiring just the odd bucketful of household waste water, perhaps two hundred dollars worth of hand tools.
