

Barium Rocket Tests & Crayons on Climate Charts

The chart below shows CO₂ trailing temperatures which is the norm for the last 450,000 years, but somehow, in the last 40 years the scientific narrative regarding this, magically flipped. Maybe, the IPCC is telling us the wrong thing, because this is an established fact for 450,000 years.

Even if you look back at the emails of *Climategate* during the Medieval Warming Period (MWP), they are not so sure if the unusual warming is really happening in summer responsive data. In addition, it looks like the Medieval Warming Period a thousand years ago, was very similar to today's temperatures if not warmer.

Keith Briffa himself was convinced the MWP was significant, and said so in a Climategate email written in 1999, though as far as I know at the time he never shared this view in public.

“ ... For the record, I do believe that the proxy data do show unusually warm conditions in recent decades. I am not sure that this unusual warming is so clear in the summer responsive data. I believe that **the recent warmth was probably matched about 1000 years ago**. I do not believe that global mean annual temperatures have simply cooled progressively over thousands of years as Mike appears to and I contend that that **there is strong evidence for major changes in climate over the Holocene (not Milankovich) that require explanation and that could represent part of the current or future background variability of our climate**. ...

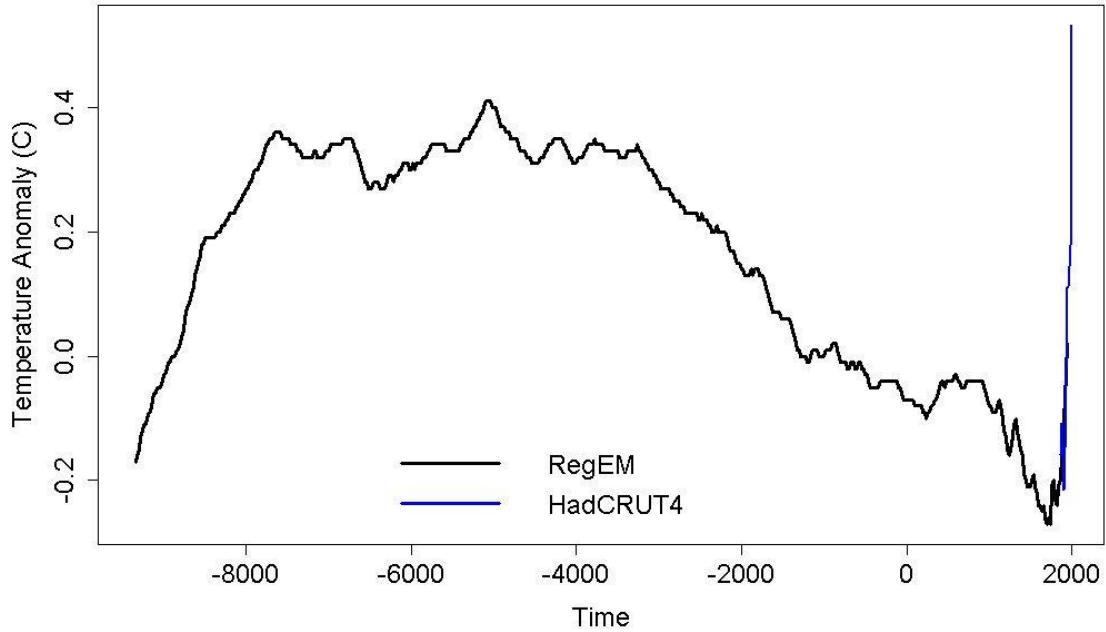

— Climategate Email: 0938018124.txt

Let's take a look at the Greenland Ice Core Survey Project, otherwise known as the gold standard for climate and temperature reconstruction on our planet, the GISP2. As can be seen, the peak marked as Medieval Warming Period is warmer than today's temperatures.

Yet somehow, this debunked Marcott 2013 et al, looks like children scratching crayon on this climate reconstruction, but is still making the rounds. In my opinion, putting this out to social media streams is purposeful deception.

Marcott 2013

When we look at University of Alabama Huntsville (UAH), March 2019 temperatures they are at 0.34 degrees Celsius above the baseline.

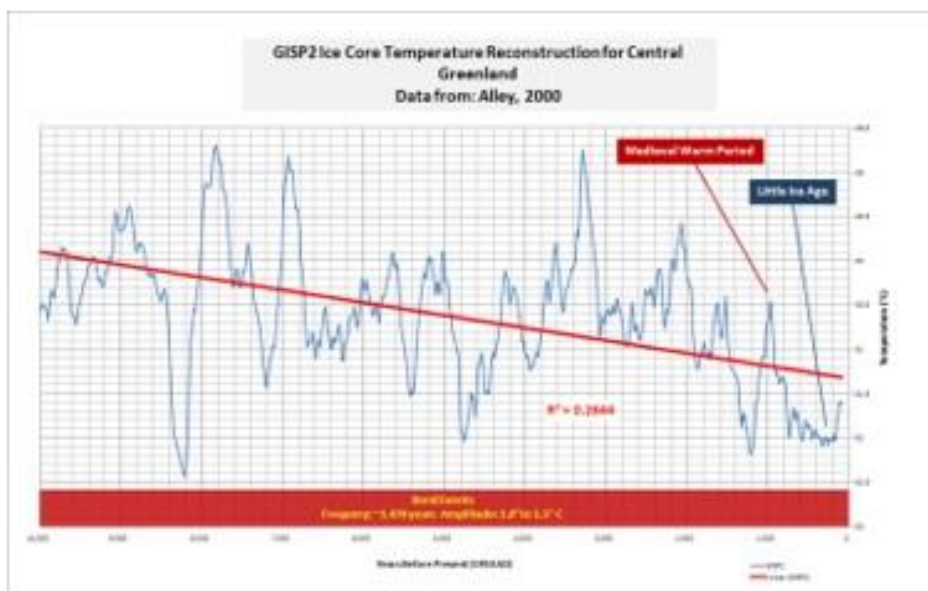

UAH Global Temperature Update for March, 2019: +0.34 deg. C.

April 1st, 2019

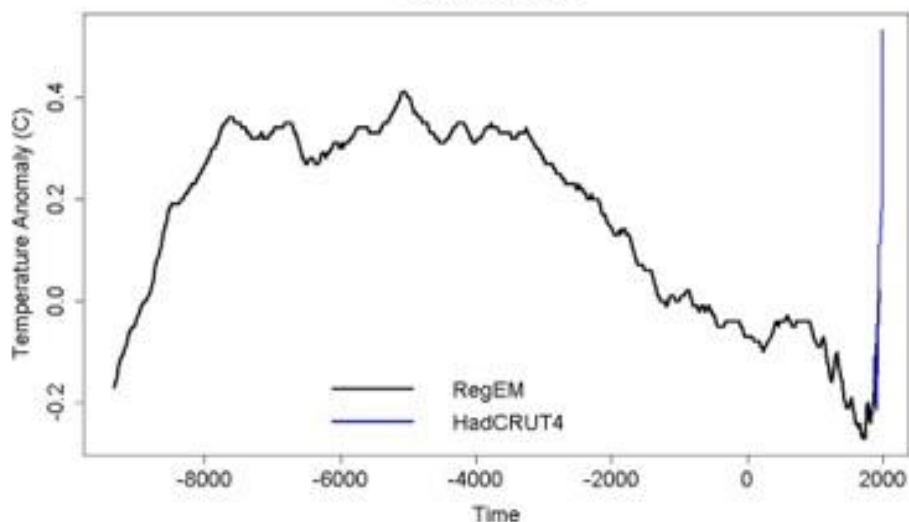

The Version 6.0 global average lower tropospheric temperature (LT) anomaly for March, 2019 was +0.34 deg. C, down slightly from the February, 2019 value of +0.37 deg. C:

Let's put these together for better analysis. The top chart is the gold standard GISP2 temperature reconstruction of our Earth for the last 10,000 years, while the marking with blue crayon on the bottom, is from Marcott 2013. There sure are a lot of peaks left out especially when you go left on the chart, back from the present day with where the blue crayon mark is. They missed several heat spikes for the last 2,000 years. Was that on purpose?

Marcott 2013

Meanwhile, state governments will help you do ridiculous stuff like this, a 1% surcharge added to restaurant bills in California. Apparently, this will go to California Air Resources Board to be spent on “worthy projects”, with no oversight.

Do you mean all that tax money gets funneled somewhere, but they are not going to be audited because a separate side board is taking care of all the worthy projects?

That is just like the “global tax” they want to institute to fund the IPCC, or the UN fund that will have no culpability because they are not audited. These are exactly the same, but on a very minor scale. I think they might be beta-testing this to see if anybody will ask where the money goes, or if it ever does get collected based on the false premise of Global Warming.

Ryan Maue  @RyanMaue · 10h

California restaurants to add 1% surcharge (tax) on bills to combat climate change / weather. 

The money would be collected & presumably turned over to the California Air Resources Board to be spent on worthy projects.

Initiative Aims To Combat Climate Change By Charging Restaurant C...

Restaurant owners have the option of charging customers an additional 1% on their bills that would go to help stop climate change.

sacramento.cbslocal.com

How will you respond when you see record snow accumulation totals across the Northern Hemisphere for the second year in a row, in the same months, breaking all-time records for snowfall? Then somebody tries to tell you that it is caused by warming oceans?

You can show this chart from *Climate4you* and show that the oceans were nearly as warm in 1998 as they are today, and they have also kept the same trajectory of heat.

Climate4you

Global monthly average sea surface temperature (SST) since 1979 according to [University of East Anglia's Climatic Research Unit \(CRU\)](#), UK. The data series (HadSST2) are described by [Ranier et al. \(2006\)](#). Base period: 1961-1990. The thick line is the simple running 37 month average, nearly corresponding to a running 3 yr average. Magenta line is the running 37-month average of *Argo* float measurements, shifted +0.2 degrees for easy comparison. Last month shown: February 2019. Last diagram update: 30 March 2019.

We are starting to get this snow right now due to the intensification of the Grand Solar Minimum.

What happened during the hot ocean years of 2000, 2004 to 2010? No record snows, until last year and this year. What flip do you think happened? It is the Sun and the onset of the Grand Solar Minimum?

On the other hand, what are these unusual lights in the sky? This is rocket testing with barium and other types of chemicals, known as rocket-borne experiments. This involves special chemicals, and they will never tell you what those are.

UPDATE: [Frank Olsen](#), also in Norway, posted the following photo, and said that this was indeed rocket-borne experiments containing special chemicals:

But, Jim Lee at *Climateviewer.com* goes into great detail about ionospheric heaters, geophysical warfare and what all those little colored dots in the sky mean. This too, is a must-watch video. Also, if you are interested, I included the link of my two-hour interview with Jim last year, at the end of this article about Geoengineering to take credit for a cooling planet in a cycle that will naturally cool the Earth. IPCC can take credit for the cooling and ask for more tax money because it worked and must be “on going”

It is expected that during these uncertain times, climate data manipulation through government agencies will be rampant, to try to mask the cooling on our planet. How prepared are you for food scarcity and food price rises? Are you protecting your own food supply?

Thanks for reading, I hope you got something out of the article. If you like more information like this, I produce the tri-weekly Mini Ice Age Conversations podcast, 30 minutes of in-depth analysis on the GSM you can take on the go.
